DETAILED ACTION

Double Patenting

Claims 24-27 are rejected under the judicially created doctrine of obviousness-type double patenting as being unpatentable over claims 13, 18, 22, and 23 of U.S. Patent No. 6,633,389. Although the conflicting claims are not identical, they are not patentably distinct from each other because claim 23 of the patent discloses the second and third method steps as claimed in claim 24 of the present application, that of measuring the intensity of the light from the measurement spot of light scanning on the material and using the intensity to determine the material under test. The claim, however, fails to explicitly state the use of a differential interferometer in the process of actually scanning the measurement spot of light. However, claim 22, which is dependent on claim 13, states that the generation of the phase profile is performed through the use of a differential interferometer. Since claim 23 is dependent on claim 13 through claim 18, the phase profile generated directly by the steps of claim 23 uses the differential interferometer as claimed in claim 22, and the combination of those claims leads to the method of the present application. The dependent claims are inherent to the method of the independent claim.

Response to Arguments

Applicant's arguments with respect to claims 24-27 have been considered but are moot in view of the new ground(s) of rejection.

Conclusion

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. A dual spot confocal displacement sensor to Poris (US Pat. No. 6,657,216).
